PROFILE

Software Engineer with a strong product vision and full-stack development expertise. I operate at the intersection of engineering and product, turning user needs and business challenges into high-performing digital solutions. From technical implementation to product strategy, I design, build, and scale high-impact products.

EDUCATION

Université Paris Cité 2024–2026

Master's Degree, MIAE

Information systems, organizational management, data analysis, IT project management.

Université Paris Cité 2021–2024

Bachelor's Degree in Computer Science

Development, databases, information systems, and business process analysis.

PROFESSIONAL EXPERIENCE

HumanX — Paris July 2024 – Present

Co-founder

Application development and resolution of product and technical challenges.

- Build applications and shape brand identity while integrating technical considerations
- Solve technical challenges by implementing automation solutions
- Drive an exploratory, iterative approach to test hypotheses and learn continuously
- Coordinate the technical, product, legal, financial, and marketing dimensions
- Lead application development and the implementation of administration tools

Thales — Paris March 2026 – Present

AI Engineer

Applied research and development of a decision-support tool for SAFe PI Planning, the subject of my research thesis.

- Design a multi-objective optimization engine (six-objective NSGA-II with memetic local search) for Program Increment task scheduling
- Build an orchestrated multi-agent architecture with conditional human-in-the-loop to assist PI Planning decision-makers (RTE, Product Owners)
- Model risk through Critical Chain-inspired safety buffers and validate the approach with an experimental campaign (100% feasible schedules, statistically significant gains)

Thales — Paris September 2023 – March 2026

Data Project Manager

Management of complex data projects with a proactive, technical approach.

- Translate operational needs into data solutions, incorporating data analysis
- Analyze complex problems and implement technical solutions to improve decision-making
- Lead automation projects to optimize processes
- Build decision-support dashboards and key indicators to improve performance management
- Implement robust solutions to resolve inconsistencies and improve data quality

PROJECTS

Get5Stars — Automated customer review collection SaaS

End-to-end design and development of a post-purchase review collection SaaS: intelligent rating routing (5 ★ → Trustpilot/Google, negative reviews intercepted privately), one-click Shopify integration, and AI-generated responses. Full-stack development, deployment, security, UI/UX, and complete customer relationship management.

TypeScript · Node.js · Stripe · Shopify API · AI · Brevo · Email automation

MIA CV — Multi-agent AI SaaS

Design of a multi-agent AI SaaS system for CV generation, incorporating data analysis.

SaaS · AI · API · LLM · Python

TipsYou — Digital payment and tipping mobile app

Led a mobile payment application integrating automation solutions.

Stripe · API · React Native

AI Agent — Website generation for the restaurant industry

Design of an AI SaaS prototype to generate websites for the restaurant industry.

SaaS · AI · API · Computer Vision

Intelligent Memory — AI mobile application

Development of a mobile application featuring intelligent memory for leveraging video content.

AI · Computer Vision · Mobile Development

AWARDS

Alan X Mistral AI Hackathon — Finalist & Winner of the ElevenLabs track

Built a voice AI agent integrated into the Alan app that proactively calls members after a consultation for personalized medical follow-up. A multilingual (FR/EN) voice agent combining Mistral (Voxtral + Small 4), ElevenLabs, and LiveKit for real-time streaming, powered by Thryve wearable data. Challenges: multi-API orchestration, real-time latency, and GDPR compliance.

BIG Berlin Hack {Tech Europe} — Winner of the Reonic track & 2nd place out of 380+ participants

Built Iconic: from a single address, generates a 3D model of a house with optimal placement of solar panels, heat pump, battery, and EV charger — built in 36h. From-scratch reconstruction of Google Solar via a proprietary 21-variant algorithm, integration of satellite captures (Google + Cesium), GPT Image for building isolation, and fal.ai for 3D mesh generation. Challenges: geospatial optimization and real-time 3D rendering.

Paris AI Hackathon {Tech Europe} — Finalist & Winner of the fal side challenge

Built FixIT: from a single photo of a broken object, generates a personalized step-by-step repair video in 90 seconds. Pipeline: GPT-5.5 Vision (object identification and defect localization) → Tavily (real web sources) → fal chaining GPT Image 2 and Seedance 2.0 (image-to-video), with parallel narration via Gadium. Challenges: multi-model chaining and visual consistency of the video.

SKILLS

Technical Skills: Python, SQL, Web Development, Back-end, Front-end, C, Java, JavaScript, TypeScript, PHP, DAX, M, HTML, CSS, Application Development, React.js, Next.js, NestJS, Spring, LLM

Soft Skills: Problem-solving, Technical curiosity, Project management, Team coordination, Planning, Prioritization, Budget tracking, Decision-making

LANGUAGES

French (Native), English (C1), Spanish (B1)
